Repeated Scenario in 2025

Mars

The **Mars** Marketing-DCom team needed a single, unified platform to efficiently create and deploy their new Starburst ad campaign across all channels.

ServiceTitan

The **ServiceTitan** Marketing team struggled to find an efficient way to produce images and complex videos for their new Business app promotion.

Zillow

The **Zillow** advertising team needed a simple, unified platform to quickly create and launch new ad campaigns promoting their mobile phone app.

Blocker Removal Strategy

Week 01

Problems/Needs Space

Understanding the current blockers and common needs from ⅔ of the customers (Mars and ServiceTitan)

Days 6-7

Solution Space

Implementation of a first prototype using ai-studio application drafting capacity

Days 8-9

Customized Solution Space

Customizing the PoC to 3 MVPs fitting customers requirements in term of functionality and authentication

Week 03

Application(s) Deployment

Deployment of the MVPs in customers' environments

AI Image and Video Scene Creator

Generate Video

Checklists

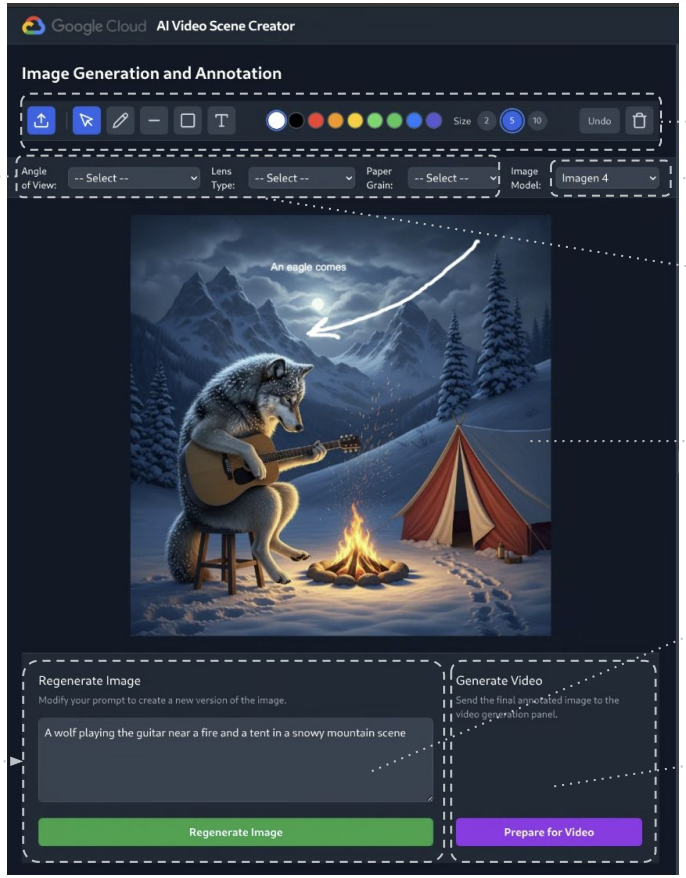
Select a checklist

image to annotated image

- [ ] 1. Image Import or Generation
  Import an existing image, or generate a new image with a text prompt.
- [ ] 2. Image Annotation
  Use the Annotation toolbox to annotate the image. From the toolbox, select the straight line, curved line, bounding box, text annotation you want. Use the Undo button to erase the latest annotation created. Use the size selector to increase the visibility of the annotations if needed. You can use the color palette to organize the annotations in a color-based way that helps the image-to-video model generation.
- [ ] 3. Finalize & Export
  Download the annotated image on your local computer for future usage.
- [ ] Remark about Video generation
  With an annotated image, no text prompt is needed to create a video from the image. However, if a text promtp is provided for the video generation, the model will try to fit both the image annotations and the text prompt. Also, the annotations are visible on the first frames of the generated video, and disappear.

Image New / Easier (than Prompting) Functionalities

Proprietary + Confidential



Toolbar for image annotations (used for video generation)

Model selection

Access to Photography styles/techniques knowledge-base for automatic prompt enhancement (used for image generation)

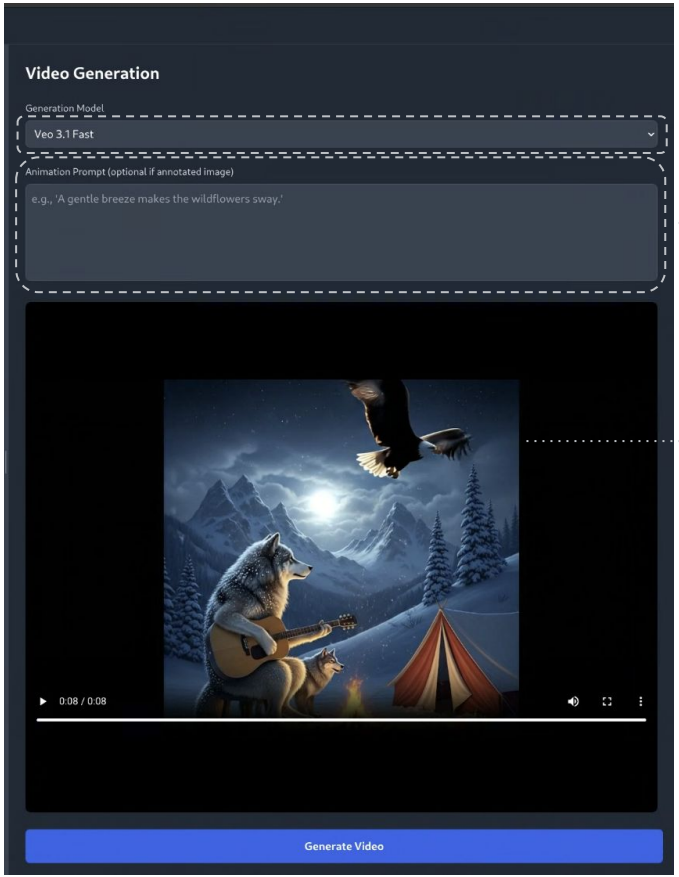
Image display with interactive image annotations capacity

Automatic Prompt Enhancement following Photography styles/techniques selected.

Bridge between Image Generation and Video Generation, translating annotated images into video scene scenario

Video New Functionalities

Proprietary + Confidential



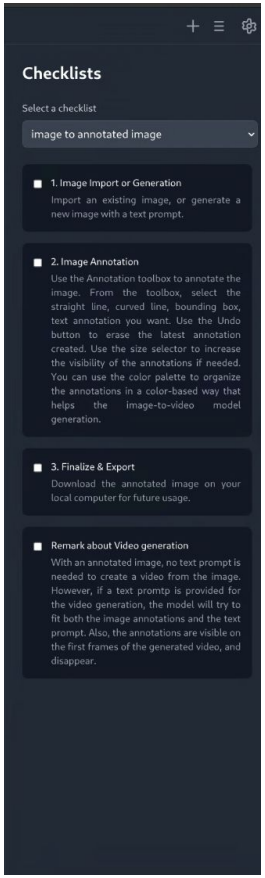
Model selection

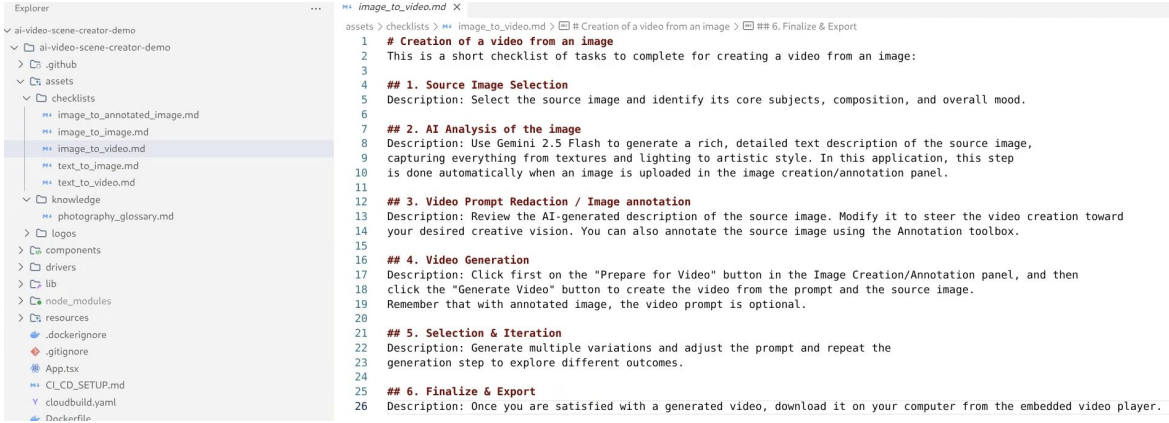
Prompting capacity, usable as standalone scene description, or in conjunction with annotated image used as first frame and complex scene description

Video display showing the scene integrating the combination of the prompt instruction and the image annotations.

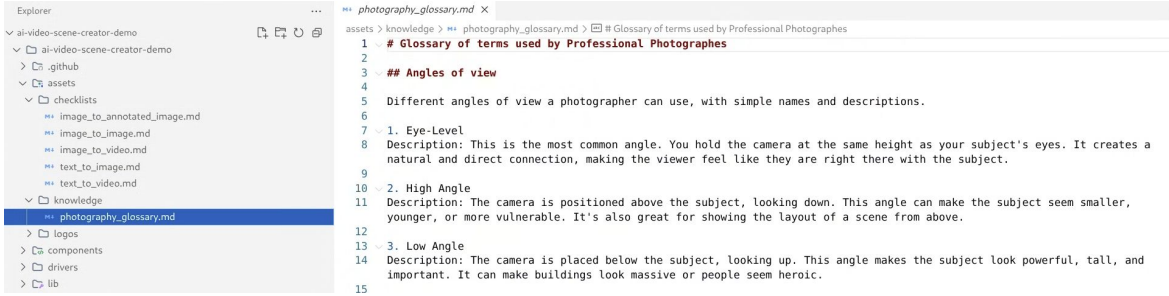
Integrated Support and Updatable Knowledge

Proprietary + Confidential





Generative workflow checklists explaining the Content Creation Process are directly included into the application as checkbox lists. A simple markdown format has been chosen for easy update.



The Semantic Layer used by the Image Generation model is also using simple Markdown format for easy update.

Application Auth(s) Requirements - The Pros

Proprietary + Confidential

Customers were direct final stakeholders. They were not IT department, and wanted a **direct access to the application by providing API keys**, and nothing more elaborated.

The Pros

- **Frictionless Integration**: It requires zero complex implementation. There are no OAuth flows, no callback URLs, and no token refreshing logic to write. The application simply passes a header (e.g., x-api-key: <KEY>) and can immediately access the generating engines.
- **High Performance and Statelessness**: Validating an API key is fast. It only requires a quick cache or database lookup, avoiding the computational overhead of verifying cryptographic signatures (like with JWTs). The server doesn't need to maintain any session state.
- **Clear Tenant Tracking**: An API key perfectly identifies the project or tenant making the request. This makes it very easy for you to track aggregate API usage and calculate billing per project and people knowing the key.

Application Auth(s) Requirements - The Cons

Proprietary + Confidential

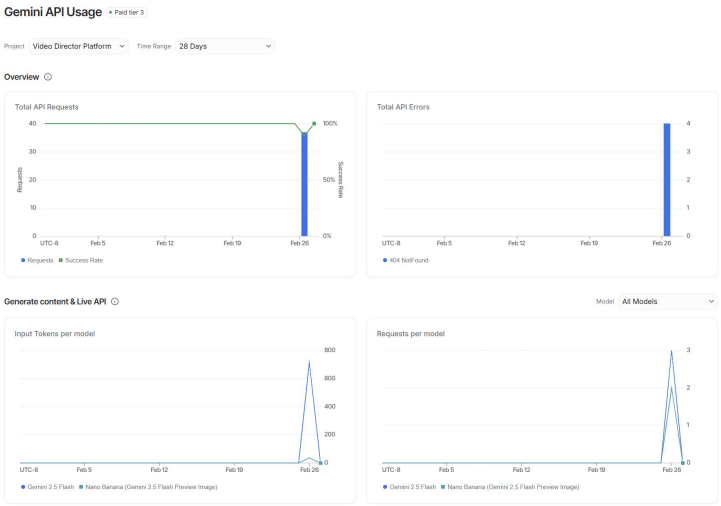
Customers were direct final stakeholders. They were not IT department, and wanted a **direct access to the application by providing API keys**, and nothing more elaborated.

The Cons

- **Severe Financial Exposure**: If a customer accidentally commits their key to a public repository or exposes it in front-end code, attackers will hijack it.
- **No Built-in Expiration**: Unlike OAuth access tokens that expire in 15 to 60 minutes, API keys can live indefinitely until manually revoked. A compromised key remains a persistent, unlimited attack window.
- **Lack of User-Level Identity**: The logs will only show that the customer's API key made the request; but no visibility into which specific end-user is responsible.
- **Painful Key Rotation**: When a key is compromised, revoking it causes immediate downtime for the customer. They must generate a new key, update their environment variables, and redeploy their application to restore service.
- **Coarse-Grained Access**: API keys are often "all-or-nothing." rather than being scoped to just one specific action.

Proprietary + Confidential

Application Auth(s) Requirements - Risks Mitigation for non-technical audience



Risks Mitigation for non-technical audience

- **Strict Quotas and Rate Limiting**: Implement hard daily spending limits and aggressive rate limits (e.g., X video generations per minute) per key to cap the potential financial damage of a leaked key.
- **Anomaly Detection**: Monitor for unusual spikes in traffic. If a key that usually generates 50 images a day suddenly requests 5,000, automatically suspend the key and alert the customer.
